

Corn Fractionation and the Resulting Distillers Grains Product and Marketing

In today's tight Ethanol market, it is critical to achieve the maximum plant efficiencies and the most profitable co-products possible. The new corn Dry Fractionation process, designed specifically for an Ethanol plant, is attracting attention due to its ability to offer higher plant capacity, increased enzyme and water efficiencies, as well as additional and higher value co-products. What are these new co-products and why are they better? What are the changes in DG and syrup? What markets does this open up? What price are they selling for?
